

Now Deliver Change

Introduction and objective:

This is a collective campaign highlighting the need for action from all stakeholders - industry, financiers, communities and policy makers - to accelerate the pace of renewable energy growth. Renewables are now recognised as the fastest, cleanest, most cost effective and secure way to decarbonise in this crucial decade - but the record breaking deployment is still not fast or fair enough.

The letter below, supported by a wide range of multi-stakeholders, is a specific call for governments to incorporate ambitious, specific, and actionable **renewable energy targets into their Nationally Determined Contributions (NDCs)** in alignment with the 1.5°C climate goal. These targets are crucial to provide market certainty, encouraging private sector investment, and facilitating the global energy transition. There is now an urgency to move from global commitments to collaboration, national targets and local implementation to achieve the global tripling of renewable energy capacity by 2030.

Timing:

This letter, part of the wider [Mission 2025](#), will be published on the occasion of the UN General Assembly and New York Climate Week in September 2024 by a diverse global group of organisations representing industry, finance and civil society from across the world. It calls on governments to **Now Deliver Change** through updated **Nationally Determined Contributions (NDCs)**.

3xRenewables campaign:

In 2023, we urged governments to commit to a global target of tripling renewable energy capacity by 2030, which was subsequently agreed at COP28. This call was endorsed by over 300 multinational corporations, non-governmental organisations, think tanks, collectively representing a market value exceeding \$11 trillion ([open letter 2023](#)). This year, we call on governments to capture the unique opportunity of the updated **Nationally Determined Contributions** and **Now Deliver Change** on scaling up renewable energy.

See the open letter below

Open letter from over [...] organisations supporting collective action on the pace of renewable deployment, and a specific call on governments to align updated NDCs and integrated energy plans with 1.5°C goals to triple renewable energy capacity globally by 2030.

Dear World Leader

We, a global coalition of organisations, recognise and applaud your leadership in committing to a global tripling of renewable energy capacity by 2030 at COP28. We are committed to support the acceleration of renewable deployment at all levels and take the necessary actions to meet the 3xRenewables goal, including progress on grids and storage. However, there is now an urgency to move from global commitments to collaboration, national targets and local implementation to achieve this target and accelerate the energy transition.

As part of the wider Mission 2025 campaign, we encourage you to **Now Deliver Change** by swiftly developing ambitious Nationally Determined Contributions (NDCs) with numerical renewable energy targets and enabling policy reforms that are:

- **Ambitious:** aligned with the GST outcome and 1.5°C pathways.
- **Specific:** include quantifiable, renewable energy capacity targets for 2030 and 2035.
- **Actionable:** be underpinned by robust energy, resource and investment plans that provide certainty to the industry and finance sector.

Setting renewable energy targets in NDCs and integrated energy plans, aligned with broader emission reduction goals, can help close the ambition gap and chart a clear path to tripling renewable energy capacity, alongside the transition away from fossil fuels. We emphasise the need for plans that ensure the benefits of renewables are equitably distributed and that the process leaves no one behind. Grid infrastructure and storage should also be recognised as critical elements in a swift and secure energy transition.

A decisive commitment from national governments to incorporate renewable energy targets into their NDCs, alongside building the enabling policy conditions, will send a strong political and market signal, providing greater investment security. Clear and ambitious targets within NDCs offer long-term policy certainty, reduce investment risks and encourage private sector participation. Over 86% of renewable energy investments came historically from the private sector. Investors are more likely to commit substantial capital to projects when they have confidence in the stability and predictability of government policies.

After the UAE Consensus, it is time to maintain the political momentum for accelerating renewable energy, doubling energy efficiency and transitioning away from coal, oil and gas, across the world. It is Time 4 Action and time for NDCs to be brought into the mainstream dialogue as a crucial vehicle for implementing the 3xRenewables target by 2030. This letter

sends a clear message to governments: NDCs are not just a United Nations requirement but a commitment to our children and grandchildren. They signify the global community's roadmap to securing a sustainable future and fostering a prosperous economy for future generations.

We, the signatories of this letter representing private sector, industry, finance, civil society from across the world, ask governments to **Now Deliver Change** by developing ambitious NDCs with specific renewable energy targets by February 2025. We stand ready to work together with governments, investors, industry and civil society to deliver the step change in renewable energy deployment needed to power sustainable economic growth and protect our planet for the benefit of people across the world.
